(54) Title: CHEMICAL COMPOUND

(57) Abstract

A novel calix[4]arene compound, application of the compounds as an active component in a calcium sensitive sensor, and a calcium sensitive sensor containing the compound. The calix[4]arene compound has general formula (I). The sensor is not very sensitive to sodium and potassium ions.

## CHEMICAL COMPOUND

This invention relates to a novel chemical compound,  
the application of the compound as an active component  
5 in a calcium sensitive sensor, and a calcium sensitive  
sensor containing the compound. More particularly, the  
compound is a derivative of calix[4]arene.

Calixarenes comprise a class of cyclic compounds pre-  
10 pared from p-alkylphenols and formaldehyde in the pres-  
ence of a catalytic amount of a base. Calixarenes are  
disclosed in Gutsche CD. Calixarenes. Acc Chem Res  
1983; 16: 161-70. The synthesis procedures for ca-  
lix[4]arene, calix[6]arene and calix[8]arene suggested  
15 by Gutsche CD are disclosed in Organic Synthesis 1989;  
68: 234-46.

Calix[4]arene is usually represented as follows:

20

25

30

or

2

5

or

10

or

15

20 and the systematic IUPAC term for calix[4]arene is:

pentacyclo[19,3,1,1<sup>3,7</sup>,1<sup>9,13</sup>,1<sup>15,19</sup>]-octacosa-1(25),3,5,7  
(28),9,11,13(27),15,17,19(26),21,23-dodecaene-25,26,27,  
28-tetrol.

25

The ion binding properties of calixarenes have recently  
been recognized, see e.g. Arduini A et al. The prepara-  
tion of a new lipophilic sodium selective ether ester  
ligand derived from p-t-butylcalix[4]arene. Tetrahedron  
1986; 42: 2089-100 and Arduini A et al. p-t-butyl-  
calix[4]arene tetra-acetamide: a new strong receptor  
for alkali cations. J Incl Phenom 1988; 6: 119-34. The  
use of calixarenes in ion selective electrodes is dis-  
closed in the following scientific papers and patents:

Shono et al. Japanese Patent Publication 1-250750 (1989). Sodium ion-selective membrane electrode.

- 20 To particular applications optical ion selective sensors are preferred over ion selective electrodes. Optical sensors based on calixarenes and/or the ion binding properties of calixarenes are disclosed in the following scientific papers:

- 25 Deng G et al. Light-responsive metal encapsulation in calix[4]arene. Chem Lett 1992; 1287-90;

- 30 Shimizu et al. Chromogenic calix[4]arene. Chem Lett 1991; 2147-50;

- 10 King AM et al. A highly selective chromoionophore for potassium based upon a bridged calix[4]arene. *J Chem Soc Chem Commun* 1992: 582-84; and

- 15 Kubo Y et al. Synthesis of a 1,3 bis(indoaniline)-derived calix[4]arene as an optical sensor for calcium ion. *J Chem Soc Chem Commun* 1993: 305-307.

The only published work so far dealing with a calcium sensitive calixarene based optical sensor is thus Kubo's above-mentioned 1993 paper.

20

From the data disclosed by Kubo it is obvious that the selectivity for calcium ions towards potassium and sodium ions is inadequate in case the optical sensor is to be used for measurement of physiological fluids such as blood, plasma, serum, etc.

25

Further, Kubo's calixarene compound cannot stand sterilization. The compound will be destroyed when subjected to radiation sterilization or ETO sterilization. Due to the fact that in some physiological applications, particularly the invasive application, it is essential to use sterilized sensors, sensors based on the calixarene compounds of Kubo are unsuitable for these applications.

30  
35

It is an object of the present invention to provide a novel calix[4]arene compound having improved selectivity properties for calcium ions and being more stable during sterilization than present calcium sensitive calix[4]arene derivatives.

The object is accomplished by the calix[4]arene compound according to the invention, said compound being characterized by the general formula

 5  $R^{24}$  is straight chain or branched alkyl of 1-4 C-  
 atoms, and  $R^{25}$  is  $-H$ ,  $-SO_3H$ ,  $-SO_3Li$ ,  $-SO_3Na$  or  $-SO_3K$ ,

with the proviso that when  $Z$  is  $-CH=CHAR$  and  $Ar$  is  
 phenyl, at least one of the substituents  
 10  $R^4, R^5, \dots, R^8$  of the phenyl group must be different  
 from  $H$ , and when  $Z$  is  $-CH=CHAR$  and  $Ar$  is 1-naph-  
 thyl, at least one of the substituents  $R^9, R^{10}, \dots, R^{15}$   
 of the 1-naphthyl group must be different from  $H$ ,  
 and when  $Z$  is  $-CH=CHAR$  and  $Ar$  is 2-naphthyl, at  
 15 least one of the substituents  $R^{16}, R^{17}, \dots, R^{22}$  of the  
 2-naphthyl group must be different from  $H$ .

Preferred compounds are compounds of the type (I)  
 wherein  $Ar$  is a phenyl group having at least one sulph-  
 20 oxylate substituent, particularly compounds of the  
 general formula

wherein  $R^4, R^5, \dots, R^8$  are each selected from -H and  $-\text{SO}_2\text{CH}_2\text{CH}_2\text{OR}^{25}$ ;  $R^4, R^5, \dots, R^8$  not all being H,  $R^{25}$  has the meaning stated above, and X is -OH or  $-\text{OR}^1$ , whereby  $R^1$  has the meaning stated above.

5

Particularly preferred compounds are compounds of the type (II) wherein  $R^{25}$  is  $-\text{SO}_3\text{H}$ ,  $-\text{SO}_3\text{Li}$ ,  $-\text{SO}_3\text{Na}$  or  $-\text{SO}_3\text{K}$ , as said compounds are suitable for being bound covalently to polymers with available -OH groups, e.g. cel-

 least one of the substituents  $R^{16}, R^{17}, \dots, R^{22}$  of the  
 2-naphtyl group must be different from  $H$ .

Particularly preferred calcium sensitive sensors con-  
 25 tain as an active component any of the preferred com-  
 pounds mentioned above.

The calcium sensitive area must be located such that it  
 will contact the sample when using the sensor. Thus,  
 30 the calcium sensitive area must be located on the sur-  
 face of the sensor facing the sample.

For practical applications the calcium sensitive active  
 component will most often be immobilized in a polymeric  
 35 membrane.

To ensure good contact between a sample whose calcium content is to be determined and the calcium sensitive active component, the polymeric membrane is preferably a hydrophilic polymeric membrane, especially a membrane  
5 provided from one of the following compounds: celluloseacetate, cellophane, cuprophane, polyvinylacetate, polyhydroxyethylmethacrylate (poly-HEMA) or another hydrogel.

10 In another preferred embodiment the calcium sensitive area comprises a calcium permeable membrane, and the calcium sensitive active component is located in a compartment of the sensor adjacent the membrane.

15 The sensor may be constituted by a so-called dipping sensor, usually rod-shaped, the calcium sensitive area of which is located at one end of the sensor on the surface of the sensor facing the surroundings. The sensor may also constitute a part of a measuring cu-  
20 vette designed for containing a sample. In the latter case, the sensor will most often constitute a measuring cuvette wall part. The measuring cuvette may be designed for disposable use or may be provided as an integral component of an analyzer for the determination  
25 of the calcium content in samples, preferably physiological samples.

The invention will be further described by the following experiments and in connection with the drawing  
30 where:

Fig. 1 shows absorption spectra for a preferred calix[4]arene compound according to the invention in the absence of metal ions and with the addition of potassium, sodium and calcium ions;  
35

Fig. 2 shows absorption spectra for the same calix-[4]arene compound having a varying content of calcium ions.

5 The spectra shown in Fig. 1 and Fig. 2 are recorded on an absorption spectrophotometer of the type Kontron UVIKON-860. Both figures show a spectrum of a solution of  $5.5 \cdot 10^{-5}$  mol/L of compound (4) described below, i.e. 5,17-bis(4-nitrophenyldiazo)-26,28-dihydroxy-25,27-  
10 bis(ethoxycarbonylmethoxy)calix[4]arene in 96% ethanol/tetrahydrofuran (2:1 v/v). In the figure the compound (4) is designated "ligand". In Fig. 1 is also shown spectra of the same solution to which is added  $6.67 \cdot 10^{-3}$  mol/L of sodium, potassium and calcium per-  
15 chlorate, respectively. It is seen that addition of calcium ions displaces the absorption peak by 100 nm from 397 nm to 497 nm, whereas addition of sodium and potassium ions only results in a negligible change of the absorption spectrum.

20

Fig. 2 shows, apart from the spectrum of the pure ligand solution, spectra of the same solution to which is added varying quantities of calcium ions corresponding to calcium concentrations of  $3.33 \cdot 10^{-4}$ ;  $6.67 \cdot 10^{-4}$ ;  
25  $3.33 \cdot 10^{-5}$ ;  $6.67 \cdot 10^{-5}$ ;  $3.33 \cdot 10^{-4}$ ;  $6.67 \cdot 10^{-4}$ ;  $3.33 \cdot 10^{-3}$  and  $6.67 \cdot 10^{-3}$  mmol/L. As seen, the absorbance varies clearly with varying calcium concentrations at the absorption peak. Thus, it will be possible to establish a mathematical model or a standard curve from which the con-  
30 tent of calcium ions in an unknown sample may be determined.

### Experimental

#### Qualitative determination of calcium with a glass sensor

2 mg of compound (6) described below, i.e.

5 5,17-bis-(2,4-dinitrophenyldiazo)-26,28-dihydroxy-  
25,27-bis(hydroxycarbonylmethoxy)calix[4]arene, is  
added to a mixture of 2.3 mL water, 2.5 mL methanol and  
2.5 mL tetramethoxysilane. 5 drops of 0.1 M KOH is  
added with stirring. The reaction mixture was left for  
10 4 days in order to gel (formation of a glass) for 4  
days in a beaker (6 cm diameter) and was then vacuum-  
dried for 2 hours at 40°C.

The glass formed was then washed thoroughly with dilut-  
15 ed HCl and distilled water.

A piece of the glass was brought in contact with 0.1 M  
aqueous solutions of sodium chloride, potassium chlo-  
ride and calcium chloride. In the solution of calcium  
20 chloride the colour of the glass changed. In the solu-  
tions of sodium chloride and potassium chloride there  
was no visually detectable change of colour.

#### Preparation of calix[4]arene compounds and intermedi- 25 ates therefor

The compounds prepared are characterized by data for  
melting point, NMR, IR, by molecular weight determined  
by mass-spectrophotometry and by the result of a funda-  
mental analysis.

30

The melting points were measured by means of a digital  
thermometer.

NMR data were recorded on the following instruments:

35 Bruker AM-100, Bruker AM-250 and Varian Unity 400 spec-  
trometer.

IR spectra were recorded using KBr technique on a Perkin Elmer FT-IR 1760X spectrometer.

UV/Vis spectra were measured at room temperature on a Kontron UVIKON-860 and a Perkin Elmer Lambda-9.

- 5 Some of the microanalyses differ more than one would normally accept. This is due to incomplete removal of small neutrals molecules included in the lipophilic cavity of calix[4]arene, e.g. solvent molecules like:  $\text{CH}_2\text{Cl}_2$ , EtOAc, toluene, etc.

The reaction mixture is heated to reflux for 18 h. The solvent is evaporated and the residue is extracted with  $\text{CH}_2\text{Cl}_2$ /5% HCl. The organic layer is separated and dried with  $\text{MgSO}_4$ .
- 20 After evaporating the solvent the residue is triturated with MeOH and heated to boiling and cooled to 5°C, then filtered and washed with MeOH.

35 with stirring followed by quenching with 20 mL  $\text{H}_2\text{O}$ , 10%

HCl is added dropwise until the precipitate is dissolved. The reaction mixture is transferred to a separation funnel together with 100 mL CHCl<sub>3</sub> and 50 mL H<sub>2</sub>O. The organic phase is isolated and dried with MgSO<sub>4</sub> and the solvent is evaporated. Purification is performed on silica with 2% MeOH in CH<sub>2</sub>Cl<sub>2</sub> as eluent, and the yellow band with a R<sub>f</sub>=0.45 is collected.

Yield: 0.340 g (66%).

5,17-bis(4-nitrophenyldiazo)-26,28-dihydroxy-25,27-bis(ethoxycarbonylmethoxy)calix[4]arene (4)

0.50 g (0.84 mmol) 1 is dissolved with stirring in 50 mL THF and 3 mL pyridine. The reaction mixture is cooled on ice. 0.58 g (2.45 mmol) 4-nitrophenyldiazonium tetrafluoroborate is added in small portions to ensure that the temperature does not exceed 5°C. After stirring and cooling for 2 hours the temperature is allowed to rise to room temperature and the reaction is left for another 14 hours. The solvent is evaporated and the red solid is dissolved in 50 mL CH<sub>2</sub>Cl<sub>2</sub> and extracted with 2 x 50 mL 5% HCl. The organic phase is dried with MgSO<sub>4</sub>, and the solvent is evaporated to give a red semi-solid. The solid is purified on a short

silica column with  $\text{CH}_2\text{Cl}_2$  as eluent and isolated as a foam after removing the solvent. The foam is dissolved in a small amount of  $\text{CH}_2\text{Cl}_2$  and precipitated with EtOH, filtered and washed with EtOH. The resulting substance is airdried.

5,17-bis(2,4-dinitrophenyldiazo)-26,28-dihydroxy-25,27-bis(ethoxycarbonylmethoxy)calix[4]arene (5)

0.67 g (1.1 mmol) 3 is dissolved in a mixture of 20 mL  $\text{CHCl}_3$  and 20 mL MeOH. 1.0 g (2.5 mmol) 2,4-dinitrophenylhydrazine (50% in  $\text{H}_2\text{O}$ ) is dissolved in about 80 mL MeOH/ $\text{CHCl}_3$  and added with stirring to the solution of 3. Then the reaction mixture is heated at reflux for 2 hours and left for 14 hours at room temperature. The solution is filtered to give red crystals. The crystals are dissolved in a small amount of  $\text{CHCl}_3$  and triturated with MeOH to give glistening crystals.
